 $\mathbf{Q}\mathbf{1}$

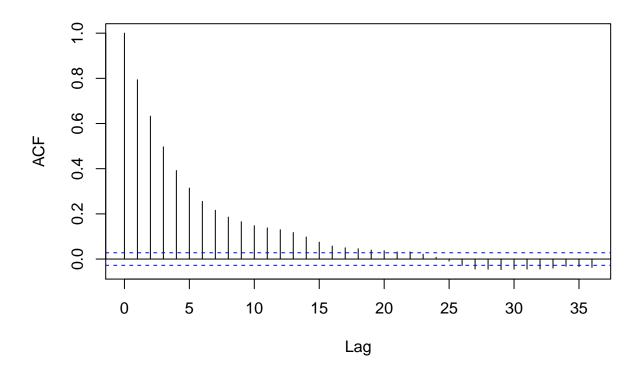

Plot of y against time

PACF plot for y

ACF plot for y

```
adftest <- adf.test(ts(first_series$y))
## Warning in adf.test(ts(first_series$y)): p-value smaller than printed p-value
pp <- pp.test(first_series$y)</pre>
```

Warning in pp.test(first_series\$y): p-value smaller than printed p-value

The ACF plot has an exponentially decaying ACF. ADF test returned 0.01 and PP test returned 0.01, thus we have sufficient evidence to reject the null hypothesis that there exists a unit root at 0.05 significance level. The time series is likely stationary. The ACF is decaying while the PACF has a significant spike at t-1. Thus, it is likely that the appropriate model is AR(1). ## c

```
Arima(first_series$y, order = c(1,0,0), include.mean = TRUE)
```

```
## Series: first_series$y
  ARIMA(1,0,0) with non-zero mean
##
##
  Coefficients:
##
            ar1
                   mean
##
         0.8003
                 9.9665
## s.e. 0.0086
                 0.0696
##
## sigma^2 estimated as 0.9694:
                                  log likelihood=-7016.58
## AIC=14039.17
                  AICc=14039.17
                                   BIC=14058.72
```

The PACF plot had t-1 as the significant spike, thus I started with and ARIMA(1,0,0) model. The AIC value generated was 1.4039165×10^4 .

```
Arima(first_series$y, order = c(2,0,0), include.mean = TRUE)
## Series: first_series$y
## ARIMA(2,0,0) with non-zero mean
##
## Coefficients:
##
            ar1
                    ar2
                           mean
         0.7922 0.0102 9.9666
##
## s.e.
        0.0141 0.0142 0.0704
##
## sigma^2 estimated as 0.9695: log likelihood=-7016.33
## AIC=14040.65
                  AICc=14040.66
                                  BIC=14066.72
```

AR(2) generated a larger AIC of 1.4040654×10^4 , so AR(1) was the closer fitting model. AR(3) generate even larger AIC of 1.4040342×10^4 , thus I chose AR(1). ## d To check for autocorrelation in the residuals, I fitted an AR(2) model for the residuals and did an F-test.

```
residuals <- Arima(first_series$y, order = c(1,0,0), include.mean = TRUE)$residuals residuals_frame <- data.frame(cbind(residuals[3:5000], residuals[2:4999], residuals[1:4998])) colnames(residuals_frame) <- c("t","t1","t2") residuals_lm <- lm(t ~ t1 + t2 - 1, data = residuals_frame) # p-value 0.3232, cannot reject null hyp th summary(residuals_lm)
```

```
##
## Call:
## lm(formula = t ~ t1 + t2 - 1, data = residuals frame)
##
## Residuals:
##
      Min
                1Q Median
                                3Q
                                       Max
## -3.5354 -0.6501 0.0005 0.6680
                                   3.4194
##
## Coefficients:
##
     Estimate Std. Error t value Pr(>|t|)
                 0.01414 -1.109
## t1 -0.01569
                                     0.267
## t2 0.01407
                  0.01408
                            0.999
                                     0.318
##
## Residual standard error: 0.9803 on 4996 degrees of freedom
## Multiple R-squared: 0.0004521, Adjusted R-squared:
## F-statistic: 1.13 on 2 and 4996 DF, p-value: 0.3232
```

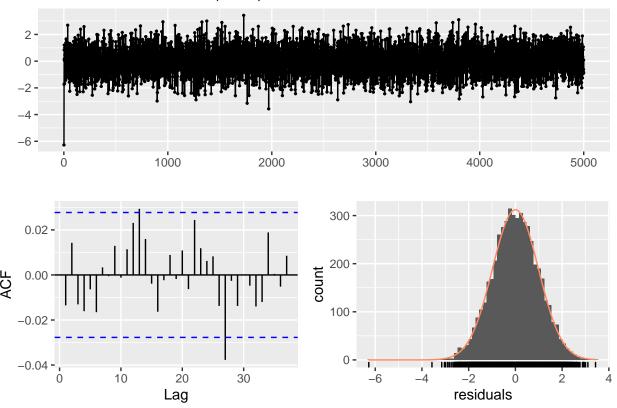

The p-value is 0.3232, thus we cannot reject the null hypothesis that the partial effects of lags u_{t-1} and u_{t-2} are equal to 0. Thus there is no serial correlation of lag 2. There is a constant mean of 0, since we regressed without an intercept and

Thus, the residuals resemble white noise.

A Breusch-Godfrey test was also conducted on the regression of residuals. Using the forecast package, a Ljung-Box test was also conducted directly on the ARIMA model object.

```
checkresiduals(Arima(first_series$y, order = c(1,0,0), include.mean = TRUE))
```

Residuals from ARIMA(1,0,0) with non-zero mean

```
##
## Ljung-Box test
##
## data: Residuals from ARIMA(1,0,0) with non-zero mean
## Q* = 6.5518, df = 8, p-value = 0.5857
##
## Model df: 2. Total lags used: 10

lmtest::bgtest(t ~ t1 + t2, data = residuals_frame, order = 2)
```

```
##
## Breusch-Godfrey test for serial correlation of order up to 2
##
## data: t ~ t1 + t2
## LM test = 1.5268, df = 2, p-value = 0.4661
```

The high p-values mean that we cannot reject the null hypothesis of no serial correlation under significance level of 0.05.

2

a

$$E(y_i|x_{i1},x_{i2}) = E(\beta_0 + \beta_1 x_{i1} + \beta_2 x_{i2} + u_i|x_{i1},x_{i2}) = E(\beta_0|x_{i1},x_{i2}) + E(\beta_1 x_{i1}|x_{i1},x_{i2}) + E(\beta_2 x_{i2}|x_{i1},x_{i2}) + E(u_i|x_{i1},x_{i2}) = \beta_0 + \beta_1 x_{i1} + \beta_2 x_{i2} + u_i|x_{i1},x_{i2}) = \beta_0 + \beta_1 x_{i1} + \beta_2 x_{i2} + u_i|x_{i1},x_{i2}) = \beta_0 + \beta_1 x_{i1} + \beta_2 x_{i2} + u_i|x_{i1},x_{i2}) = \beta_0 + \beta_1 x_{i1} + \beta_2 x_{i2} + u_i|x_{i1},x_{i2}) = \beta_0 + \beta_1 x_{i1} + \beta_2 x_{i2} + u_i|x_{i1},x_{i2}) = \beta_0 + \beta_1 x_{i1} + \beta_2 x_{i2} + u_i|x_{i1},x_{i2}) = \beta_0 + \beta_1 x_{i1} + \beta_2 x_{i2} + u_i|x_{i1},x_{i2}) = \beta_0 + \beta_1 x_{i1} + \beta_2 x_{i2} + u_i|x_{i1},x_{i2}) = \beta_0 + \beta_1 x_{i1} + \beta_2 x_{i2} + u_i|x_{i1},x_{i2}) = \beta_0 + \beta_1 x_{i1} + \beta_2 x_{i2} + u_i|x_{i1},x_{i2}) = \beta_0 + \beta_1 x_{i1} + \beta_2 x_{i2} + u_i|x_{i1},x_{i2}) = \beta_0 + \beta_1 x_{i1} + \beta_2 x_{i2} + u_i|x_{i1},x_{i2}) = \beta_0 + \beta_1 x_{i1} + \beta_2 x_{i2} + u_i|x_{i1},x_{i2}) = \beta_0 + \beta_1 x_{i1} + \beta_2 x_{i2} + u_i|x_{i1},x_{i2}) = \beta_0 + \beta_1 x_{i1} + u_i|x_{i1},x_{i2} +$$

b

 $Var(y_i|x_{i1},x_{i2}) = Var(\beta_0 + \beta_1 x_{i1} + \beta_2 x_{i2} + u_i|x_{i1},x_{i2}) = 0 + 0 + Var(u_i|x_{i1},x_{i2}) = P(y_i = 1|x_{i1},x_{i2})(1 - P(y_i = 1|x_{i1},x_{i2})) \implies 0 + 0 + Var(u_i|x_{i1},x_{i2}) = P(y_i = 1|x_{i1},x_{i2})(1 - P(y_i = 1|x_{i1},x_{i2})) \implies 0 + 0 + Var(u_i|x_{i1},x_{i2}) = P(y_i = 1|x_{i1},x_{i2})(1 - P(y_i = 1|x_{i1},x_{i2})) \implies 0 + 0 + Var(u_i|x_{i1},x_{i2}) = P(y_i = 1|x_{i1},x_{i2})(1 - P(y_i = 1|x_{i1},x_{i2})) \implies 0 + 0 + Var(u_i|x_{i1},x_{i2}) = P(y_i = 1|x_{i1},x_{i2})(1 - P(y_i = 1|x_{i1},x_{i2})) \implies 0 + 0 + Var(u_i|x_{i1},x_{i2}) = P(y_i = 1|x_{i1},x_{i2})(1 - P(y_i = 1|x_{i1},x_{i2})) \implies 0 + 0 + Var(u_i|x_{i1},x_{i2}) = P(y_i = 1|x_{i1},x_{i2})(1 - P(y_i = 1|x_{i1},x_{i2})) \implies 0 + 0 + Var(u_i|x_{i1},x_{i2}) = P(y_i = 1|x_{i1},x_{i2})(1 - P(y_i = 1|x_{i1},x_{i2})) = P(y_i = 1|x_{i1},x_{i2})(1 - P(y_i = 1|x_{i1}$

Thus a linear probability model cannot be homoskedastic, because it is a Bernoulli process and the error variance is a function of the independent variables.

 \mathbf{c}

An increase of \$1000 in income leads to increase of 0.08 chance of buying a car, holding education constant. An increase of 1 year of education leads to increase of 0.01 chance of buying a car holding income constant.

 \mathbf{d}

$$\hat{y}_i = -0.1 + 0.08 \cdot 8 + 0.01 \cdot 16 = 0.7$$

There is a 0.7 chance that this person has a car.

 \mathbf{e}

$$\hat{y}_i = -0.1 + 0.08 \cdot 15 + 0.01 \cdot 16 = 1.26 > 1$$

There is a 1.26 chance that this person has a car. This result does not make sense, since $P(y = 1|x_{i1}, x_{i2}) \in [0, 1]$. To solve it, let

$$\hat{y}_i = \begin{cases} 0, & \text{if } \hat{\beta}_0 + \hat{\beta}_1 x_{i1} + \hat{\beta}_2 x_{i2} < 0 \\ 1, & \text{if } \hat{\beta}_0 + \hat{\beta}_1 x_{i1} + \hat{\beta}_2 x_{i2} > 1 \\ \hat{\beta}_0 + \hat{\beta}_1 x_{i1} + \hat{\beta}_2 x_{i2}, \hat{y}_i \in [0, 1] \end{cases}$$

Then, $\hat{y}_i = -0.1 + 0.08 \cdot 15 + 0.01 \cdot 16 = 1$, there is probability of 1 that this person has a car.

 $\mathbf{3}$

 \mathbf{a}

Let

$$CDF = \Phi(z), PDF = \phi(z), z = \beta_0 + \beta_1 x_1 + beta_2 x_2 + \beta_3 x_3 + \beta_4 x_4 + \beta_5 x_5 \frac{\partial P(y=1|X)}{\partial x_1} = \frac{\partial}{\partial x_1} \int_{-\infty}^{z} \phi(z) dx_1 = (2\pi)^{-\frac{1}{2}} \cdot e^{-\frac{z^2}{2}} \cdot \beta_1 dx_2 + \beta_2 x_3 + \beta_4 x_4 + \beta_5 x_5 \frac{\partial P(y=1|X)}{\partial x_1} = \frac{\partial}{\partial x_1} \int_{-\infty}^{z} \phi(z) dx_1 = (2\pi)^{-\frac{1}{2}} \cdot e^{-\frac{z^2}{2}} \cdot \beta_1 dx_3 + \beta_4 x_4 + \beta_5 x_5 \frac{\partial P(y=1|X)}{\partial x_1} = \frac{\partial}{\partial x_1} \int_{-\infty}^{z} \phi(z) dx_1 = (2\pi)^{-\frac{1}{2}} \cdot e^{-\frac{z^2}{2}} \cdot \beta_1 dx_3 + \beta_2 x_5 \frac{\partial P(y=1|X)}{\partial x_1} = \frac{\partial}{\partial x_1} \int_{-\infty}^{z} \phi(z) dx_1 = (2\pi)^{-\frac{1}{2}} \cdot e^{-\frac{z^2}{2}} \cdot \beta_1 dx_3 + \beta_2 x_5 \frac{\partial P(y=1|X)}{\partial x_1} = \frac{\partial}{\partial x_1} \int_{-\infty}^{z} \phi(z) dx_1 = (2\pi)^{-\frac{1}{2}} \cdot e^{-\frac{z^2}{2}} \cdot \beta_1 dx_3 + \beta_2 x_5 \frac{\partial P(y=1|X)}{\partial x_1} = \frac{\partial}{\partial x_1} \int_{-\infty}^{z} \phi(z) dx_1 = (2\pi)^{-\frac{1}{2}} \cdot e^{-\frac{z^2}{2}} \cdot \beta_1 dx_3 + \beta_2 x_5 \frac{\partial P(y=1|X)}{\partial x_1} = \frac{\partial}{\partial x_1} \int_{-\infty}^{z} \phi(z) dx_1 = (2\pi)^{-\frac{1}{2}} \cdot e^{-\frac{z^2}{2}} \cdot \beta_1 dx_3 + \beta_2 x_5 \frac{\partial P(y=1|X)}{\partial x_1} = \frac{\partial}{\partial x_1} \int_{-\infty}^{z} \phi(z) dx_1 = (2\pi)^{-\frac{1}{2}} \cdot e^{-\frac{z^2}{2}} \cdot \beta_1 dx_3 + \beta_2 x_5 \frac{\partial P(y=1|X)}{\partial x_1} = \frac{\partial}{\partial x_1} \int_{-\infty}^{z} \phi(z) dx_1 = (2\pi)^{-\frac{1}{2}} \cdot e^{-\frac{z^2}{2}} \cdot \beta_1 dx_3 + \frac{\partial}{\partial x_1} \int_{-\infty}^{z} \phi(z) dx_1 = \frac{\partial}{\partial x_1} \int_{-\infty}^$$
